1 VERSION HISTORY

Version 2.5.0.1

1. Support WIFI Direct(WIFI P2P).

Version 2.5.0.0

2. Supporting Linux Kernel 2.6.35.
3. Fixed Ad-hoc issue: STA didn't use legacy rate when STA is Ad-hoc creator and security is OPEN-WEP or WPAPSK-TKIP.
4. Fixed WPS issue: Beacon lost when STA tries to do WPS with WPS AP or STA connects to hidden AP.
5. Fixed WPS issue: WPS procedure is taking much longer than before.
6. Corrected WPS behavior: According to the response from WFA: while doing PBC, STA shall stop if STA finds more than one AP avaliable.
7. Fixed issue: WPS failed with Ralink WpaSupplicant when STA's privacy is different from AP's privacy. (for example: AP is WPA2PSK but STA is OPEN)
8. Fixed Ralink WpaSupplicant issue - Scan table didn't include RSSI.
9. Fixed issue: STA had problem to show 32-bytes SSID when user uses "iwpriv ra0 show SSID" or "iwpriv ra0 stat" to check SSID of WSC profile.
10. Fixed issue: If there are two APs have same SSID, AuthMode and EncrypType but different WPAPSK key, driver will only try the AP with better RSSI. If that AP with better RSSI has the different WPAPSK with STA, driver still keeps trying to connect that AP with better RSSI.
11. Refine the stack size of all functions to be smaller than 1024B.
12. Fixed WPS issue: When session overlap detect, the WPS LED will not turn off for WPS LED mode 9 after 2 minutes timeout.
13. Fixed issue: Use wrong rate index in send_monitor_packets().
14. Improve scan mechanism.
15. Fixed issue: STA supports the WPA authentication which group cipher is WEP
16. Support to generate random WSC 4-digits PIN.
17. Fixed issue: Single SKU Bandedge Delta value decrease all channels transmit power on FCC, it should work on Channel 1 / 11.
18. Add pre-allocate memory in module insert stage.
19. Refuse scan query while scanning.
20. Fix ATE frequency offset bug.
21. Fix ATE Rx sensitivity no good issue.
22. Fix EfuseFreeNumberCount bug.
23. Fix TSSI structure in big endian issue.
24. Fix Efuse_FreeBlockNumber bug.
25. Update EDCA parameters for WMM 27T6 test.

3.3 More information

The subsequent instructions are for automatically loading the rt5370 driver at boot time

A) choose ra0 for first RT5370 WLAN card, ra1 for second RT5370 WLAN card, etc.
B) create(edit) 'ifcfg-ra0' file in /etc/sysconfig/network-scripts/,
edit(or add the line) in /etc/modules.conf:
alias ra0 rt5370sta

C) edit(create) the file /etc/sysconfig/network-scripts/ifcfg-ra0
DEVICE='ra0'
ONBOOT='yes'

Note: if you use dhcp, add "BOOTPROTO='dhcp'"

D) To ease the Default Gateway setting, add the line
GATEWAY=x.x.x.x
in /etc/sysconfig/network

5 WPS – WI-FI PROTECTED SETUP

Simple Config Architectural Overview

This section presents a high-level description of the Simple Config architecture. Much of the material is taken directly from the Simple Config specification.

Figure 1 depicts the major components and their interfaces as defined by Wi-Fi Simple Config Spec. There are three logical components involved: the Registrar, the access point (AP), and the Enrollee.

- The **Enrollee** is a device seeking to join a WLAN domain. Once an Enrollee obtains a valid credential, it becomes a member.
- A **Registrar** is an entity with the authority to issue and revoke domain credentials. A registrar can be integrated into an AP.
- The **AP** can be either a WLAN AP or a wireless router.

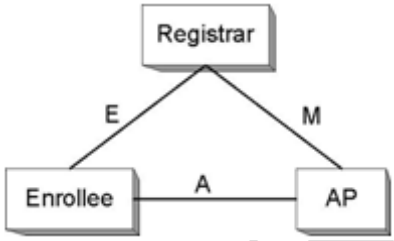

Figure 1. Components and Interfaces

Registration initiation is ordinarily accomplished by a user action such as powering up the Enrollee and, optionally, running a setup wizard on the Registrar (PC).

7.7 Example

7.7.1 Hardware access

```
iwpriv ra0 bbp 0                    # read BBP register 0
iwpriv ra0 bbp 0=12                 # write BBP register 0 as 0x12
iwpriv ra0 mac 0                    # read MAC register 0
iwpriv ra0 mac 0=1234abcd           # write MAC register 0 as 0x1234abcd
iwpriv ra0 e2p 0                    # read E2PROM 0
```

```
iwpriv ra0 e2p c=12ab                    # write E2PROM 0xc as 0x12ab
```

7.7.2 Statistic counter operation

```
iwpriv ra0 stat                          # read statistic counter
iwpriv ra0 set ResetCounter=0            # reset statistic counter
```

7.7.3 Suggestion:

1. To turn on ATE functionality, you have to add compile flag "RALINK_ATE" to Makefile
2. Before doing ATE testing, please stop AP function
3. If you want to test another ATE action, prefer to stop AP & ATE function
4. All ATE function settings will lose efficacy after reboot.
5. Before hardware register access, please reference hardware spec.

Note.

In ATE mode, the channel must set via "ATECHANNEL"

7.8 ated

- ated - user space ATE agent program for RT5370 linux driver, Ralink Tech. Corp.
- RT5370 ATE daemon - ated, comes with RT5370 Linux driver.

The section describes the use of the Linux driver, Windows QA GUI and RT5370 ATE daemon.

7.8.1 Introduction

The ated is an optional user space component for the RT5370 linux driver. AP immediately starts working in ATE mode when "ated" starts (i.e. ATESTART). It behaves as a proxy between Windows QA GUI and RT5370 linux driver when ATE process proceeds.

ATED AUTOMATICALLY STOPS WHEN THE WINDOWS QA GUI IS CLOSED.

Ated can be stopped manually (key in '$killall ated'). The RT5370 linux driver will stop working in ATE mode when ated is stopped or the QA GUI is closed.

7.8.2 Environment setup

1. Connect the platform you want to test directly with a Windows host by ether network line.
2. In the Windows host, run WinPcap_4_0.exe for the QA GUI.

7.8.3 How to use ated for ATE purpose

1. First you should set **both "HAS_ATE=y" and "HAS_28XX_QA=y"** in the file ~/Module/os/linux/**config.mk** and compile the driver.
2. Modify the Makefile according to our target "PLATFORM".
3. Change the path of "CROSS_COMPILE" if needed.
4. Remove "-I$(INCLUDE)" about in line 39 if your target "PLATFORM" is not "PC".
5. Then type 'make' command to compile the source code of the daemon.
6. After the driver interface "ra0" has started up, attach both of "ra0" and the ethernet interface to the bridge interface "br0".
7. Manually start ated, type '$ated -bbrX -iraX'.(For further use of options, type $ated -h)

8. In the Windows host, run RT2870QA_ATE.exe.
9. Select the wired network adapter.
10. Choose 2870_ATE, then press OK.

Note:

The names of WLAN interface(default is "ra0") and Bridge interface(default is "br0") must be specified manually (for example: '$ated –b br1 –ira2') if your WLAN interface or Bridge interface is not "ra0" or "br0" respectively !
